Welcome to our tour of our amazing web application called uBarter!

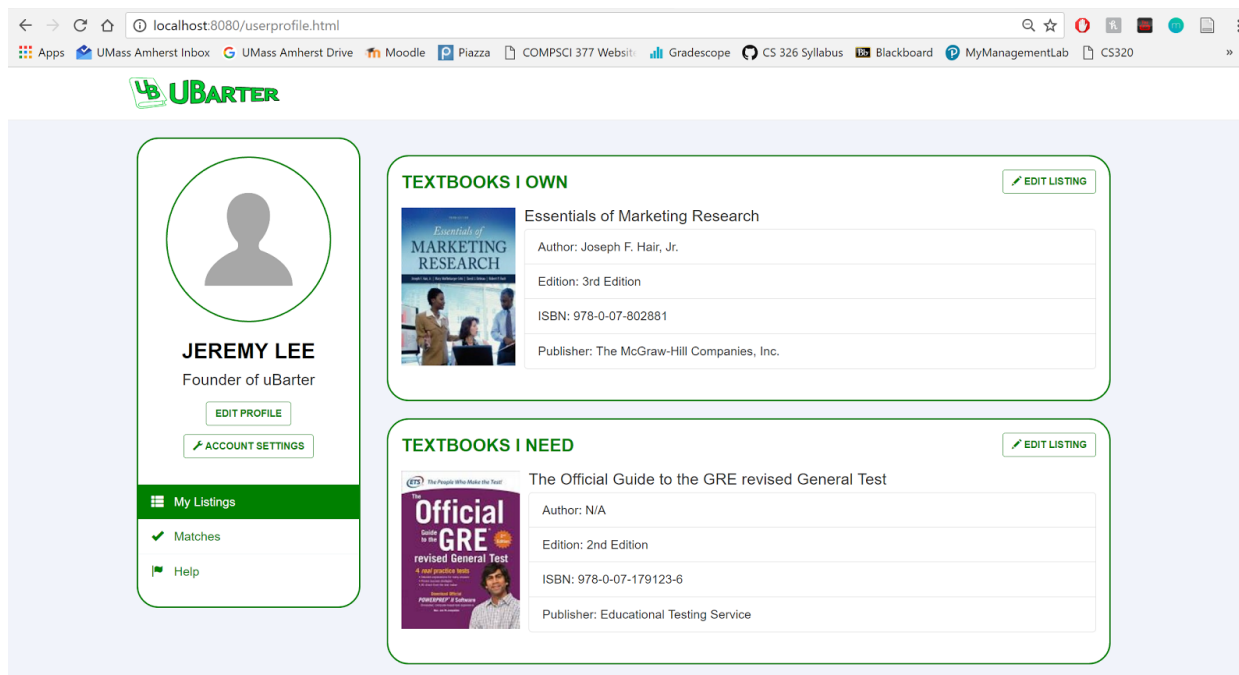

index.html “Homepage” (created by Seydeh Arta Razavi)

Index.html is the homepage of the uBarter web application that the user sees after they have logged on. The right side bar has the user’s image and name under that it lists the user’s current postings that they have up for sale or trade. The right feed shows all the items posted by other users available for sale or trade. There is also a search bar on the main page that allows the user to search for specific books/items. When the registered user clicks on their profile picture on this page, it redirects to their personal user profile page, userprofile.html. Additionally, when a user searches on this page, the search.html page will appear.

userprofile.html (created by Jeremy Lee)

The userprofile.html page focuses on a simple and clean design. When a user completes their registration on uBarter, they already setup their initial listings of textbooks and items that they own and need. Those two lists will be displayed on their user profile page. Users have the options to edit their profile, adjust account settings, and update their listings dynamically. For now, the mockup website displays the vision that we have whenever a user wants to view their personal profile. Of course, the user profile page will look different if someone were to view another user's profile if they wanted to arrange a textbook offer or exchange. The CreateListing.html page will appear when a user wants to “Edit Listing” on the user and wants to add a book onto the respective listing. The user is redirected to the matches popup page, matched.html, when the user clicks on the user menu option, “Matches” with the checkmark glyphicon.

CreateListing.html (created by Brendan Shaughnessy)

On a trading website it is necessary for users to list their items in a create listing webpage. This page has a bold title to remind users where they are. It also contains two main columns in the body one for creating a "sell" listing and one for creating a "looking for" listing. The first drop down menu has three main categories. If someone selects the book category it is important that they enter a valid isbn. The transition between screens is the submit button. Once a listing has been submitted it will take users to their profile page where they can see their newly created listing. When the user submits the book with all of the criteria fulfilled, then the plan is to have the user profile and listings updated with the submitted book.

search.html (created by Colin Stern)

Search.html is the search page of the application which users see after they search for a queried item. The page lists items which match the user's query in the center of the page, with a left sidebar which allows the user to refine their search based on category, condition and location of the item. The user can vary their search based on relevance or distance from their current location via the dropdown on the top of the page. Links at the bottom of the page allow the user to navigate farther down the search results. The navbar allows the user the access other pages of the application.

matched.html (created by SeihakRithy Muth)

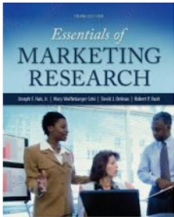

This page is displayed after the user asked our web application to match them with other users who are looking to trades. The user can go through the lists of matched trades and may contact the user to initiate a trade or to barter. The user will be redirected to the message.html page once a user wants to prompt messaging after clicking on the “Contact” button with the chat popup glyphicon.

message.html (created by David Zagreda)

Message.html is the messaging section of uBarter which the user sees after clicking on the Contact button for our matched page. The left sidebar contains a list of users who you are currently talking to, and it allows you to search for a specific conversation. The main part of the messaging section is laid out in a chat room style, and it shows communication between two specific users.
